PROJECT DESCRIPTION:

AI-Powered Cricket Player Performance and Match Analytics System Using Zoho Creator

The **AI-Powered Cricket Player Performance and Match Analytics System** is a low-code application developed using Zoho Creator to manage cricket player information, record match statistics, and analyze player performance. The application contains two main forms: **Player Registration** and **Match Performance**, which store player profiles and match-by-match performance details.

The system uses Zoho Creator features such as basic and advanced form fields, lookup fields, datasets, Deluge scripting, and automated workflows. Deluge scripts calculate batting strike rate and bowling economy, while validation rules help prevent incorrect statistical entries. Workflows can automate record processing and notify users about exceptional performances.

The application also uses reports and dashboards to display player statistics, compare performance, and identify top-performing players. An AI-based performance classification field can be configured to categorize player performances using historical match data, depending on the available Zoho Creator AI features and plan.

The main objective is to provide a centralized, user-friendly cricket analytics platform that reduces manual calculations, improves data management, and supports data-driven performance evaluation for domestic and international players.
