Exp No: 7	**Integrating a Zoho Creator application with another Zoho service using connections and APIs.**

AIM:

To integrate a Zoho Creator application with another Zoho service (Zoho CRM) using a connection and the API (Deluge invokeUrl task), so that the data submitted in the Creator form is added automatically to the other service.

ALGORITHM / PROCEDURE:

A **connection** in Zoho Creator is a secure setup that handles the authorization (OAuth) for communicating with another Zoho or third-party service. Once it is authorized, it can be used in workflows with Deluge's *integration task* and *invokeUrl* task. Connections are available only in the paid plans of Creator and are created by the super admin, admin or developer.

1. Log in to Zoho Creator and create a new application named *Lead Capture*. Add a form *Inbound Calls* with the fields Name, Company, Email and Phone.
2. Create the connection: open the application, go to **Microservices** → **Connections** and click **Create Connection**. Select the service **Zoho CRM**.
3. Give the connection name *zoho_crm_conn* (this link name is used in the script), select the scope `ZohoCRM.modules.ALL` and click **Create and Connect**. Click **Accept** in the authorization window and check that the status of the connection is *Connected*.
4. Open the form *Inbound Calls* → **Workflow** → create a form workflow that runs **On Success** of the form submission (Create) and add a **Deluge script** action.
5. Write the following script. It builds the lead data and sends it to the Leads module of Zoho CRM using the connection (POST request to the API).
6. Save the script and open the application in the live (access) mode. Submit a record in the form *Inbound Calls*.
7. Open Zoho CRM and check the **Leads** module. The record submitted from the Creator form is present as a new lead. The response printed by the *info* statement shows the code *SUCCESS*.
8. To read data in the opposite direction, use the same connection with a GET request (second script below) and show the CRM data inside the Creator application.
9. Note down the observations.

Script 1 - push the form data to Zoho CRM (On Success of the form)

```
// create the lead data using the values of the submitted form
leadMap = Map();
leadMap.put("Last_Name", input.Name);
leadMap.put("Company", input.Company);
leadMap.put("Email", input.Email);
leadMap.put("Phone", input.Phone);

dataList = List();
dataList.add(leadMap);
reqData = Map();
reqData.put("data", dataList);
```

```
// call the Zoho CRM API using the connection
response = invokeUrl
[
    url : "https://www.zohoapis.com/crm/v2/Leads"
    type : POST
    parameters : reqData.toString()
    connection : "zoho_crm_conn"
];
info response;
```

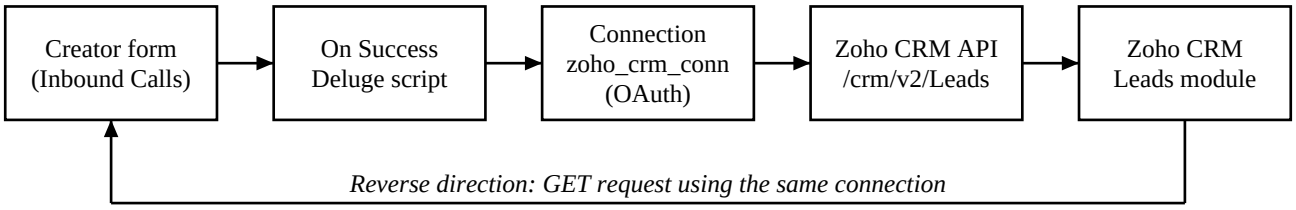
Script 2 - get the leads from Zoho CRM into Creator

```
leads = invokeUrl
[
    url : "https://www.zohoapis.com/crm/v2/Leads?fields=Last_Name,Company,Email"
    type : GET
    connection : "zoho_crm_conn"
];
info leads.get("data");
```

Note: the domain in the URL depends on the data centre of the account (zohoapis.com, zohoapis.in, zohoapis.eu). Each invokeUrl call uses one API call from the plan limit.

DIAGRAM:

Fig 1: Integration of Zoho Creator with Zoho CRM using a connection and API



RESULT:

Thus a Zoho Creator application was integrated with Zoho CRM using a connection and the API (invokeUrl). The data submitted in the Creator form was added to the Leads module of Zoho CRM, and the CRM data could also be fetched into Creator.
