Exp No: 9	**Exploring AI-assisted features and built-in analytics (Zia) in Zoho Creator.**

AIM:

To explore the AI-assisted features of Zoho Creator (Zia) such as the AI fields, Zia search and Zia insights, and to use the built-in analytics (charts and dashboard) to study the data collected in a Creator application.

ALGORITHM / PROCEDURE:

Zia is the AI assistant of Zoho. In Zoho Creator it helps the developer to build apps faster and helps the user to understand the data. The AI fields (*Sentiment Analysis*, *Keyword Extraction*, *Text Recognition / OCR*, *Business Card Reader* and *Object Detection*) fill their values automatically from the data given by the user. The built-in analytics part of Creator gives reports, charts and dashboard pages without any extra tool. The availability of some Zia features depends on the plan and the region of the account.

1. Log in to Zoho Creator and create a new application named *Customer Feedback*. Add a form *Feedback* with the fields Name, Product (dropdown), Rating (number) and Comments (multi line).
2. Open the form in the builder and, from the field palette, drag the AI field **Sentiment Analysis** into the form. In its properties select the field *Comments* as the source text. Add one more AI field, **Keyword Extraction**, with the same source field.
3. Open the application in access mode and submit 8 to 10 sample feedback records. Use some positive comments ("very good battery, fast delivery"), some negative ones ("screen broke in two days") and some neutral ones.
4. Open the report *Feedback Report* and check the records. The sentiment column shows *Positive*, *Negative* or *Neutral* and the keyword column shows the main words of each comment, filled automatically by Zia.
5. Try **Zia Search** (the search box at the top of the application) and type a question like *negative feedback for mobile* to see the matching records without writing any criteria.
6. Create a new page named *Feedback Dashboard*. Add a **Pie chart** (count of records by Sentiment), a **Bar chart** (average Rating by Product) and a **List/Summary** component showing the total number of feedbacks.
7. Open a report and use the **Zia Insights** / analytics option to see the patterns found automatically from the data (for example the product with the lowest rating).
8. To use the sentiment value in a workflow, open the form workflow (On Success of Create) and add the Deluge script given below, which sends a mail to the support team when the comment is negative.
9. Note down the observations.

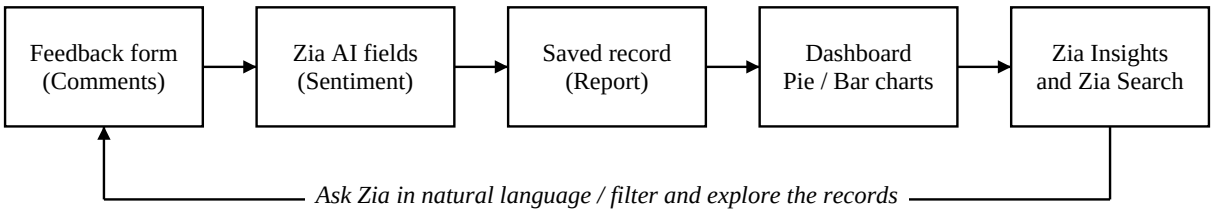
Script - alert the support team for a negative feedback (On Success of the form)

```
// check the value filled by the Sentiment Analysis AI field
if(input.Sentiment == "Negative")
{
    sendmail
    [
        from : zoho.adminuserid
        to : "support@example.com"
        subject : "Negative feedback received from " + input.Name
        message : "Product : " + input.Product + "<br>Comment : " + input.Comments
    ]
}
```

Note: the field link name (Sentiment) depends on the name given to the AI field while creating it. The AI fields work on the text only after the record is saved, so the value may take a few seconds to appear.

DIAGRAM:

Fig 1: AI-assisted features and built-in analytics in Zoho Creator



RESULT:

Thus the AI-assisted features of Zoho Creator were explored. The AI fields (Sentiment Analysis and Keyword Extraction) filled their values automatically from the comments, Zia search gave the records for a plain English query, and the dashboard charts with Zia insights helped to analyse the feedback data inside the application itself.
